

FISHPLATES

Before you plan your scheduled maintenance - read this!

The Hardlock Nut from Staytite has many advantages:

- Hardlock Nut is easy to fit because it freely spins on the thread.
- Electric power tools can be used to tighten to the required torque, which carry less risk /exposure to HAVS.
- Hardlock resists loosening by vibration longer than any traditional fastener, and therefore maintenance intervals can be reduced.
- Hardlock can be reused many times with no loss of performance. In tests after reinstallation of 50 times it held the same clamp load as its initial testing.

- The joint does not need to be opened because Interflon Rail Lube EP penetrates the joint.
- After installation, ongoing maintenance cycles take only 30 seconds.
- Maintenance performed from an upright position.
- Maintenance conducted by 1 person.

Once the fishplate has been upgraded, the joint does not need to be loosened for lubrication. Using the Interflon backpack, lubrication takes 30 seconds to perform from an upright position. Upon external application the specially formulated solution penetrates the joint automatically utilising its capillary action.

Suitable for:

Flat Bottom Kit - CAT No: 057/052115

Bull Head Kit - CAT No: 057/052113
